EP Performance Verification (PV) Targets Recommendation Form

Submission Due Date: 15th October 2023

NOTE: Please do not change or delete the words marked in blue.

1. TITLE

An X-ray band population study of coronal activities from contact binaries

2. ABSTRACT (< 250 words)

(summarize the target properties, the EP capabilities to be verified, and justify why the proposed observations and targets should be considered for the PV phase)

Contact binaries (CBs) are commonly found in the Milky Way's field stellar population. The two components of a CB fill their lobe and share a common envelope. The spectral types of such binaries usually range from F to K. Their magnitudes generally vary by less than 1 mag. The typical orbital periods range from 0.2 to 1.0 days, but peak strongly between 0.2 and 0.5 days. Two components exhibit magnetic activity, and stellar spots have been observed in past observations. The solar corona of CB shows dynamic features, including the shared convective region of X-ray emission. We have provided a contiguous CB catalogue covering the all-sky within 1kpc in the Galaxy. Regardless of how EP surveys for the PV phase are conducted, they can cover these CBs. EP observations can provide a larger sample and longer time series for a more comprehensive study of high-activity regions and their population effects in the X-ray band.

3. RECOMMENDERS' INFORMATION

Principal Recommender	
*Recommender' Name	Jinzhong Liu
*Recommender' Email Address	liujinzh@xao.ac.cn
*Recommender' Expertise	Jinzhong Liu is an expert in the observation and theoretical study of related objects in the evolution of binary stars.
*Recommender' STP(s)	STP5
Co-Recommendors	
*Recommendors' Names	Ting Wu
*Recommendors' Email Addresses	wuting@xao.ac.cn

NOTE: Please do not change or delete the words marked in blue.

*Recommenders' Expertise	Ting Wu is a PhD student in Jinzhong Liu's science group.
*Recommenders' STP(s)	None

4. TARGET FORM

- TARGET 1** (*mandatory*)

*Target Name				
*Target Type				
*Target Coordinates	*RA:		*DEC:	
*Expected Flux in 0.3-10 keV				
*Primary Instrument				
FXT Configuration <i>(mandatory if the primary instrument is FXT, optional if the primary instrument is WXT)</i>	FXT-A		FXT-B	
*Exposure Time				
Suggest Joint Observation with Other X-ray Telescopes				
Other remarks				

NOTE: Please do not change or delete the words marked in blue.

Note: * mandatory items

- TARGET 2 and more...**

(optional, if there are more than one target in this recommendation, copy the entire target form above to the empty space below; note that this is only for the case that one observing proposal includes multiple targets; for targets of a different proposal with distinct technical and scientific goals, please submit them in separate proposals.)

Target Name: CB

Target Type: EW(W UMa)

Target Coordinates: We have listed 12279 samples in the table below.

Expected Flux in 0.3-10 keV: 0.68×10^{-11} erg/cm²/s

Primary Instrument : WXT

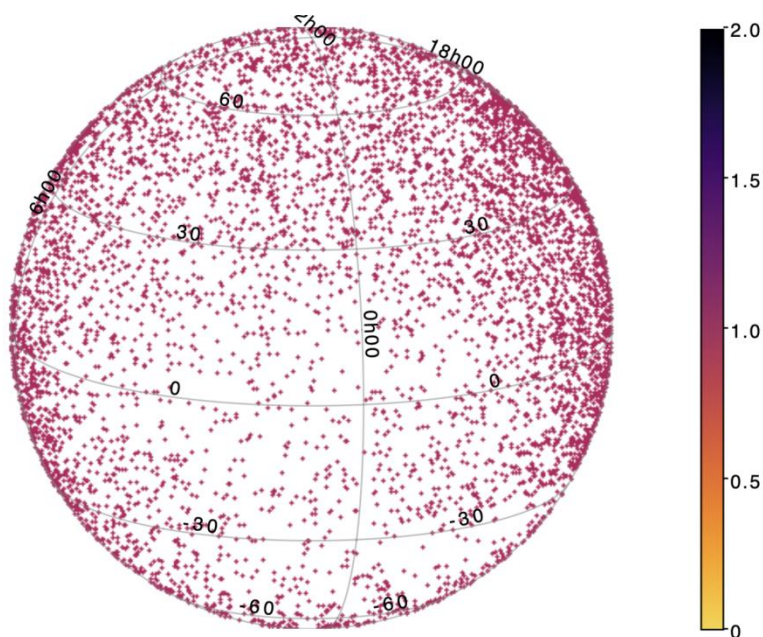

FXT Configuration: Optional

Exposure Time: at least 2000sec

Suggest Joint Observation with Other X-ray Telescopes: None

Other remarks: We can also update a document in *.csv format if needed.

The following figure is the distribution of our CB samples in this catalogue.

5. SCIENTIFIC AND TECHNICAL JUSTIFICATION

(< 2 pages in total for this session, including figures, tables and references)

- Scientific Motivations and Values**

(briefly describe the properties of targets, scientific motivations and values, and explain why the proposed target and observation should be considered for a PV program rather than a regular observing program)

Our targets are CBs with orbital periods greater than 0.2 days and less than one day[1]. The two components of the contact binary star fill the Roche lobe. Because the two components are so close together, their outer atmospheres interact significantly[2,3]. The coronal activity of these systems is more obvious[4]. The specific mechanism responsible for X-ray emission in these CBs is not well understood, but it is believed to be connected to magnetic activity from a shared convective envelope and synchronized, rapid rotation in stellar dynamos processes[5,6]. The reason for including CBs in the PV program is the complexity of the system, which requires more comprehensive observation and analysis of its highly active regions and dynamic characteristics.

- EP Capabilities to be Verified**

(briefly describe the capabilities that can be verified by the recommended targets and observations. For example: this target can demonstrate WXT's imaging capability of large field-of-view and sensitivity)

The conservatively estimated flux from coronal activities is $\sim 0.68 \times 10^{-11} \text{ erg/cm}^2/\text{s}$. The recommended 12279 all-sky targets are all within the 1kpc in the Galaxy[1], and they are field stars. These represent the full observational capability of the WXT detector in the PV phase.

- Immediate Objectives**

(listed the main objectives of the recommended targets and observations)

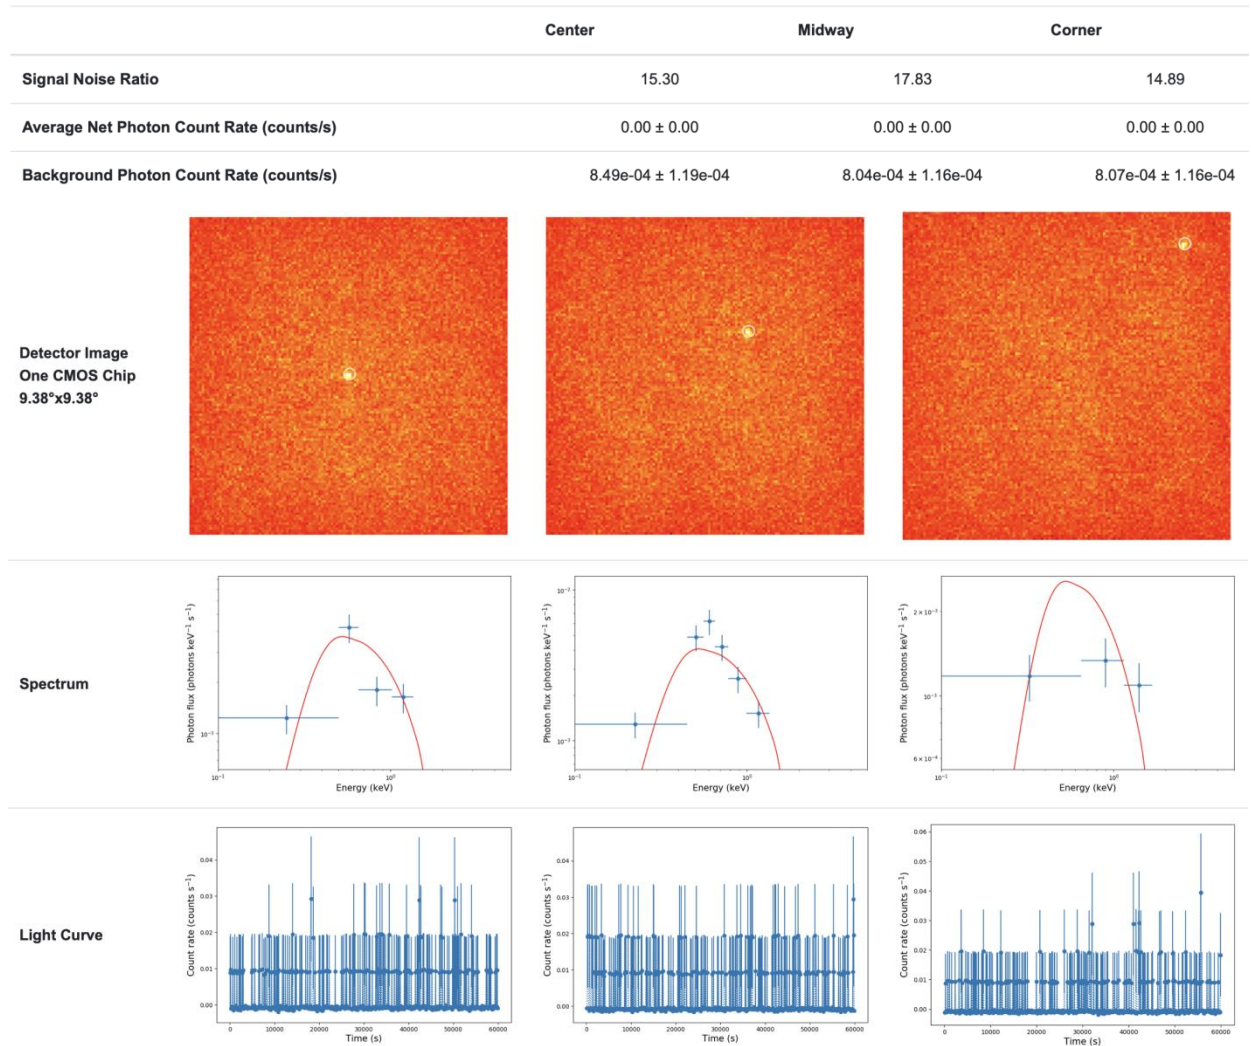

We can analyze the high-activity regions in a CB system and monitor the dynamics of mass transfer process. Meanwhile, the X-ray population physical properties of coronal activities from CBs can be investigated by EP-WXT surveys.

NOTE: Please do not change or delete the words marked in blue.

- **Technical Justification (e.g. target visibility during the PV phase)**
(briefly justify the technical feasibility of the recommended target and observation, such as the target visibility during the PV phase, brightness, variability, etc.)

During the PV phase, the selected 12279 targets will be within the field of view of the observing instrument and will have a sufficient visible time window. This will ensure that we can make full use of the PV time period for observations.

The figure below is an example of XY UMa simulated using the EP-WXT data simulator.

- **References**
(list relevant references for the recommended targets and observations)
